1 Introduction to KMD Identity

KMD Identity is a technical platform that acts as an identity broker between KMD products and their customers. The platform simplifies federated user authentication between both parties as they only need to set up federation (trust) with one partner to implement Single-Sign On for multiple products or for multiple customers.

This document describes the technical requirements for an Identity Provider (one that belongs to the customer) to federate with KMD Identity and how to get started setting up federation with KMD Identity.

2 Intended audience

The intended audience of this document is the IT of customers who would like to federate with KMD Identity.

3 Technical requirements

This chapter describes the technical requirements for a SAML based federation via KMD Identity.

3.1 Name ID

KMD Identity expects the SAML response from the customer's Identity Provider to contain a subject with a **Name ID** that is both a unique and persistent identifier of that user.

To be unique, no two users in the customer's organization may receive the same Name ID value.

To be persistent, the Name ID must not change between sessions, and it should specify the Name ID format:

urn:oasis:names:tc:SAML:2.0:nameid-format:persistent

Here are some example attributes that can be used as Name ID values (but not limited to):

- UPN
- Object ID

3.2 Claims

In addition to a subject containing a Name ID as described above, KMD Identity would like to request the following claims containing user attributes:

Claim name	Claim type	Mandatory
E-mail	http://schemas.xmlsoap.org/ws/2005/05/identity/claims/emailaddress	Yes
Given Name	http://schemas.xmlsoap.org/ws/2005/05/identity/claims/givenname	Yes
Surname	http://schemas.xmlsoap.org/ws/2005/05/identity/claims/surname	Yes
Otherphone	http://schemas.xmlsoap.org/ws/2005/05/identity/claims/otherphone	No

Note that if a KMD product requires claims that are not listed above, or if the customer wishes to restrict which products may use this federation, KMD Identity can support this by setting up a **product-specific trust** to the customer instead.

If a product-specific trust is needed for either of those reasons, let us know when making the request, so that we can register the trust accordingly.

3.3 Identity Provider SAML metadata requirements

The customer must provide KMD Identity with a link to the SAML metadata endpoint of their Identity Provider. This metadata must be publicly accessible from the Internet. KMD Identity monitors the endpoint frequently and updates our configuration based on its content.

The customer must ensure at least 10 minutes have passed after adding a new certificate, before removing the old certificate from the metadata. We recommend waiting at least 24 hours as other vendors may not monitor your metadata as frequently.

The metadata must contain organization information including an email and/or phone number that we may use to contact the customer if there are issues with the federation.

3.4 Service Provider SAML metadata requirements

Once KMD Identity has received the link to the SAML metadata endpoint of the customer's Identity Provider, we will provide a link to the SAML metadata endpoint of KMD Identity, which can be used by the customer to register KMD Identity with their Identity Provider.

This metadata endpoint is unique per trust relationship, so should not be reused.

When setting up a trust with KMD Identity as a Service Provider, make sure to monitor our metadata endpoint for changes. At minimum our metadata must be monitored for changes daily. This is essential to avoid downtime when we renew our certificates.

4 Getting started

To get started simply send an email to identity@kmd.dk, confirming that you understand and accept the technical requirements that are described in this document. Include in the email a link to the SAML metadata endpoint of the Identity Provider you want to use for this trust.

KMD Identity will then perform the necessary configuration on our end and reply with a link to the metadata endpoint that you can use to register KMD Identity as a Service Provider with your Identity Provider.

Once you have registered KMD Identity with your Identity Provider, the new federation can be tested by logging into any of the test applications listed here: <https://test.identity.kmd.dk/>

Please send the result of the test to us so that we can verify it before we allow KMD products to use the new trust.

4.1 Special circumstances

Some Identity Provider solutions also generate metadata URLs that are unique per trust relationship. As an example, Microsoft's Entra ID (formerly known as Azure AD) supports Single-Sign On via SAML using "Enterprise Applications" and each of those applications have their own "App Federation Metadata URL".

This can result in a "chicken and egg"-type situation where both parties in the trust relationship would like to receive the metadata of the other before providing a link to their own.

With Entra ID, the workaround is that you do not need to complete the setup of the enterprise application fully before being able to copy its "App Federation Metadata URL" and send that link to us.

If you cannot provide a link to the metadata of the Identity Provider solution that you are using, before having received the metadata from the Service Provider, then KMD Identity can generate metadata using placeholder data. We will then update the configuration on our end after having received the true metadata URL of the Identity Provider. Once this bootstrapping has been done, testing can commence.

If this "chicken and egg" scenario applies to your Identity Provider solution, let us know when contacting us, so that we can use placeholder data to generate our metadata endpoint.

5 Contact KMD Identity

For general questions and support: identity@kmd.dk

Secure emails can be sent to: identity@sikker.kmd.dk

The certificate used to verify our digital signature, and to send us encrypted emails, can be looked up at this url: <https://erhvervsadministration.nemlog-in.dk/search>

6 Version

Version	Date	Description	Edited by
1.0	2021-07-23	Initial version	MTA
1.1	2022-03-28	Added information about which claims are optional. Minor changes.	MTA
1.2	2024-06-12	Made clarifying changes to sections 4 and 6.1. Updated link to website in section 7.	MTA
1.3	2026-08-19	Removed "Scope" and "Terminology" section and rewrote other sections.	MTA
